Final Report: Projectathon 2022

Canada's first Projectathon was held from March 21-23, 2022. The objective of the Projectathon was to test and improve the quality of the pan-Canadian Patient Summary Interoperability Specifications (PS-CA Specifications) to ensure they are implementable, testable and meet expectations. The PS-CA supports several implementation patterns including MHD and a new Canadian National integration profile called CA:FeX. The CA:FeX supports saving and retrieving clinical data to and from a central document repository.

The aims of the Projectathon were to identify potential issues in the basic specifications, give implementers a chance to test their implementations in live environments, and strengthen implementation guidelines and standards in the health sector. This was held as a preliminary event before any conformity assessment, quality label or certification process.
